

A-Z of Hidden Disabilities

Hidden in Plain Sight

1 in 6 people worldwide live with a disability, many of which are invisible.

Hidden disabilities are those that are not immediately apparent to others. They can affect a person's physical, cognitive, sensory or emotional functioning. Some examples of hidden disabilities include:

- **Chronic illnesses:** Arthritis, diabetes, chronic pain and sleep disorders
- **Cognitive impairments:** Autism, ADHD, dyslexia, and intellectual disabilities
- **Neurological conditions:** Epilepsy, Parkinson's disease, multiple sclerosis and stroke
- **Sensory impairments:** Hearing loss, visual impairment and sensory processing disorders
- **Mental health conditions:** Depression, anxiety, bipolar disorder and PTSD

It's important to remember that hidden disabilities can vary widely in severity and impact on a person's daily life.
